APRIL 1975

NMC ARCHIVES

The purpose of this Office Note is to describe the various archive systems maintained by Automation Division, National Meteorological Center. Archive systems include permanent sequential (tape) data sets, and temporary sequential (tape) and random access (disk) data sets. The life cycle of temporary data sets is one month for tape data sets and 36 days for random access sets. The available data sets are listed below and subsequently described in detail.

1. Tape set of 00Z and 12Z LFM analysis and forecast fields.
2. Tape set of 00Z and 12Z OPERATIONAL analysis and forecast fields.
3. Tape set of 00Z and 12Z FINAL analysis and forecast fields.
4. Tape set of selected FINAL and/or OPERATIONAL analysis and forecast fields.
5. Tape set of upper air observational reports.
6. Tape set of surface observational reports.
7. Rotating 36-day disk set of selected operational analysis and forecast fields.
8. Rotating 36-day disk set of selected LFM analysis and forecast fields.

Temporary Data Sets

The temporary data (tape) sets of the three basic NMC analysis and forecast operations - LFM, OPERATIONAL (PE), and FINAL can be discussed as a group. Each tape contains the observational data required for analysis in addition to guess fields, analyzed fields, forecast fields, and sigma fields. Table 1 lists the contents of these tapes by data set name.

Each tape set contains 62 tapes, one for each 12-hour cycle in a month. Tapes are 9-track, 1600 BPI with IBM standard labels. The data for each cycle is written without file marks so that the user must search for the data set label as described in Office Note 85. Observational data is formatted as described in Office Note 29 and gridded (binary) fields as described in Office Note 84.

For most applications the VOL=SER numbers of the tapes are not required since the tapes are catalogued. For sequential use the following DD statements should be used:

```
//FTXXF001 DD DSN=NWS.NMC.HISTORY.LFMDDCY,DISP=(OLD,KEEP)  
//FTXXF001 DD DSN=NWS.NMC.HISTORY.OPNLDDCY,DISP=(OLD,KEEP)  
//FTXXF001 DD DSN=NWS.NMC.HISTORY.FNLDDCY,DISP=(OLD,KEEP)
```

where the fourth qualifier describes the tape set LFM, OPNL, or FNL and DDCY are the day of the month and cycle (00 or 12) required to identify the proper tape. For example:

```
//FT25F001 DD DSN=NWS.NMC.HISTORY.OPNL2112,DISP=(OLD,KEEP)
```

will define the OPERATIONAL HISTORY tape for the 12Z cycle on the 21st day of the current month.

To load any data set for random access use, the following procedures have been catalogued:

```
//LDLFM EXEC WWLDLFM,GES=,FMOO=,ETC=,DATE=DD,CYCLE=HH  
//LDOPNL EXEC WWLDOPNL,ANL=,F48=,ETC=,DATE=DD,CYCLE=HH  
//LDFNL EXEC WWLDFNL,ANL5=,GANL=,ETC=,DATE=DD,CYCLE=HH
```

where DD=Day of Month, HH=00 or 12.

If no DD statements are given each data set named will be placed in a temporary data set on a work pack so that the DD statement in the step using the data would be:

```
//ANL DD DSN=&&ANL,DISP=(OLD,DELETE)  
//F48 DD DSN=&&F48,DISP=(OLD,DELETE)
```

Procedures to copy and inventory these tape sets are available. In order to preserve the integrity of these tapes, users should contact NMC, Automation Division, Data Management Section for assistance.

Permanent Tape Archives

Permanent archives are created primarily for retention at the National Climatic Center (NCC), Asheville, North Carolina, and the National Center for Atmospheric Research (NCAR), Boulder, Colorado, but a master copy is also retained in NMC. A duplicate of the master tape sets is maintained in the OMCS tape library for one year. Data for periods beyond one year must be recovered from NCC, Asheville, N.C. The VOL=SER numbers of the tapes in the OMCS library are given in Table 2. These numbers are fixed and will be overwritten each year. The data set name (DSN) used on library copies of the archives and on copies made using the PROCEDURES described below is DSN=TCOPY. The contents of these tape sets include upper air observational reports, surface observational reports, and selected gridded (binary) analyses and forecasts. All tapes have IBM standard labels and are 9-track, 1600 BPI.

There are no file marks separating data sets on any of the permanent archives so that the user must search for data by "data set name" and date as described in Office Note 85. In all cases except surface records data are stacked on two tapes per month, 1st to 15th, and 16th to end of month; surface data requires three tapes in 10-day increments (1-10, 11-20, 21-30 or 31). At the end of each collection period the tapes are copied and distributed to the various libraries. Operational tapes are overwritten each month, but are inactive for alternate 15-day periods (20 days of surface data) and may be read by local users under certain conditions.

It must be emphasized that the operational permanent archives must not be used in a check-out mode for the obvious reasons that they could be overwritten or check-out may conflict with operations. Programs that require the use of operational archives should always be checked out

using library copies or private copies, and implemented routinely only with the permission of Operations Branch. These tapes have been catalogued and data definitions (DD) statements will be provided on request.

Operational archives may be copied and inventoried using the following procedures:

To copy observational data tapes (upper air and surface reports) -

```
// EXEC WWDATCPY,TYPE=(DATA TYPE)  
// TAPE=(TAPE SEQUENCE NO.),  
// OUTPUT=(VOL=SER OF OUTPUT TAPE)
```

To copy gridded fields -

```
// EXEC WWGRDCPY,TYPE=(DATA TYPE),  
// TAPE=(TAPE SEQUENCE NUMBER),  
// OUTPUT=(VOL=SER OF OUTPUT TAPE)
```

To inventory an archive tape -

```
// EXEC WWINVENT,TYPE=(DATA TYPE),  
// TAPE = (TAPE SEQUENCE NUMBER)
```

where data type is defined as:

SFC = surface data
UA = upper air data
GRD = gridded data

and, tape sequence number is:

TAPE1A or TAPE1B for data period 1st to 15th if upper air or gridded data; 1st to 10th if surface data.

TAPE2A or TAPE2B for data period 16th to end of month if upper air or gridded data; 11th to 20th if surface data.

TAPE3A or TAPE3B for surface data period 21st to end of month.

Examples are:

```
// EXEC WWDATCPY,TYPE=UA,TAPE=TAPE1A,OUTPUT=E12345  
// EXEC WWDATCPY,TYPE=SFC,TAPE=TAPE3A,OUTPUT=E67890  
// EXEC WWGRDCPY,TYPE=GRD,TAPE=TAPE2A,OUTPUT=E54321  
// EXEC WWINVENT,TYPE=GRD,TAPE=TAPE2B.
```

A. Upper Air Observational Reports

At archive time the data include all reports collected for approximately 12 hours after synoptic time. Since Feb. 1, 1975 data set ADPUPA has been archived for the 00Z, 06Z, 12Z, and 18Z periods. The complete contents of these tapes are ADPUPA, UPABOG, SIRSOB, AIRCFT, and SATWND. Record size is 5112 bytes, block size is 5120 bytes. Record format is described in Office Note 29.

Following is a table indicating the manner in which currently active observational reports are grouped into the data sets. The code figures are from TABLE R.1 (report type) of Office Note 29.

<u>Data Set Name</u>	<u>Code Figures</u>
ADPUPA	011, 021, 022, 023, 031
AIRCFT	041
UPABOG	051
SIRSOB	061
SATWND	063
ADPSFC	511, 512
SFCSHP	521, 522, 523
SFCBOG	551

B. Surface Observational Reports

The surface archive in the format described here was begun Feb. 1, 1975. Contents include ADPSFC and SFCSHP at six hourly intervals and SFCBOG used for the 00Z and 12Z operational analysis. Record format is described in Office Note 29; record size is 5112 bytes, block size is 5120 bytes.

C. Gridded Analysis and Forecasts

This archive contains selected records for each 12-hour NMC operational cycle. The contents of this archive were chosen by representatives of NCC and NCAR, and by local request. The complete contents are listed in Appendix A in the order in which they are accumulated in each cycle. An attempt is made to archive the basic data from the FINAL analysis. If not available, the OPERATIONAL analysis is used.

The first record of each cycle's data set is an inventory record. The first eight words of this record are as described in Office Note 85. Data set name is GRDARK. The remainder of the record consists of the six-word identification of each of the subsequent records archived in this cycle. The format of the various records is described in Office Note 84. Maximum record size in this collection is the 65 x 65 array (2125 words). Records are variable-span blocked 8508 bytes.

Temporary 36-Day Disk Data Sets

The 36-day disk archives were created to provide random access to a variety of data in homogeneous data sets for long range forecast guidance, but are also the basis for most verification programs and some research projects. All data sets in these archives are "rotating" in that at the end of each 12-hour operational cycle the most recent data is added in place of the oldest data in each set.

The disk archives differ from operational disk data sets in that the maximum number of records is 288 (a multiple of 36) and the data bits (CDCM) have been added to the fifth word of each record to provide unique identification (see Office Note 84).

There are two disk packs dedicated to archives, one for LFM data and one for OPERATIONAL data. Data set names are:

DSN=NWS.NMC.PROD.LFM36.QUALIF1.QUALIF2,DISP=SHR
DSN=NWS.NMC.PROD.HD36.QUALIF1.QUALIF2,DISP=SHR

QUALIF1 and QUALIF2 define specific data sets. In most cases there is only one qualifier, but where data for a specific type or level exceeded 288 records, an additional qualified data set had to be created. Tables 3 and 4 provide lists of data set qualifiers and contents of LFM36 and HD36 respectively.

Table 1
